General Supportive Care and Emergency Treatment

3.5 Intravenous Alteplase: Pre-Administration

Recommendations	COR	LOE
The potential risks should be discussed during thrombolysis eligibility deliberation and weighed against the anticipated benefits during decision making.	I	C-EO
Given the extremely low risk of unsuspected abnormal platelet counts or coagulation studies in a population, it is reasonable that urgent IV alteplase treatment not be delayed while waiting for hematologic or coagulation testing if there is no reason to suspect an abnormal test.	IIa	B-NR
Treating clinicians should be aware that hypoglycemia and hyperglycemia may mimic acute stroke presentations and determine blood glucose levels before IV alteplase initiation. IV alteplase is not indicated for nonvascular conditions.	III (NB)	B-NR
Because time from onset of symptoms to treatment has such a powerful impact on outcomes, treatment with IV alteplase should not be delayed to monitor for further improvement.	III (Harm)	C-EO
In patients eligible for IV alteplase, benefit of therapy is time dependent, and treatment should be initiated as quickly as possible.	I	A

General Supportive Care and Emergency Treatment

3.6 Other IV Thrombolytics and Sonothrombolysis

Recommendations	COR	LOE
The benefit of IV defibrinogenating agents and of IV fibrinolytic agents other than alteplase and tenecteplase is unproven; therefore, their administration is not recommended outside a clinical trial.	III (NB)	B-R
Tenecteplase administered as a 0.4-mg/kg single IV bolus has not been proven to be superior or noninferior to alteplase but might be considered as an alternative to alteplase in patients with minor neurological impairment and no major intracranial occlusion.	IIb	B-R
The use of sonothrombolysis as adjuvant therapy with IV thrombolysis is not recommended.	III (NB)	B-R

General Supportive Care and Emergency Treatment

3.5 Intravenous Alteplase: Sickle Cell Disease

- IV alteplase can be beneficial for patients with sickle cell disease and AIS
  - Case-control analysis of GWTG-Stroke found no significant impact on safety or outcomes in treatment with IV alteplase among 832 cases with sickle cell disease.

Recommendations	COR	LOE
IV alteplase for adults presenting with an AIS with known sickle cell disease can be beneficial.	IIa	B-NR

©2018 American Heart Association, Inc. All rights reserved. Unauthorized use prohibited.

General Supportive Care and Emergency Treatment

3.5 Intravenous Alteplase: Post-Administration

Recommendations	COR	LOE
In patients undergoing fibrinolytic therapy, physicians should be prepared to treat potential emergent adverse effects, including bleeding complications and angioedema that may cause partial airway obstruction.	I	B-NR
BP should be maintained <180/105 mm Hg for at least the first 24 hours after IV alteplase treatment.	I	B-NR
The risk of antithrombotic therapy within the first 24 hours following IV alteplase (with or without EVT) is uncertain. Use might be considered in the presence of concomitant conditions for which such treatment given in the absence of IV alteplase is known to provide substantial benefit or withholding such treatment is known to cause substantial risk.	IIb	B-NR
